

Trends in employer costs for defined benefit plans

By Richard Works

Defined benefit pension plans can provide financial security to retirees who receive the monthly benefit payments throughout their retirement. Defined benefit plans are pension plans that provide guaranteed income during retirement, and are often based on a formula that considers years of service and a percentage of a worker's salary. Employers have traditionally offered defined benefit plans to their employees, but the high costs associated with these plans have caused many employers to switch to alternate retirement plan options.¹ In March 2015, costs for defined benefit plans for private industry employers were approximately 61 cents per employee hour worked, on average.

However, when data are averaged only by the employers that offer these plans, the costs are much higher. In this **Beyond the Numbers** article, we'll explore how costs fluctuate by industry, occupation, establishment size, and region, and review trends in costs for employees with access to these plans from 2008 to 2015.

Costs for defined benefit plans are collected by the Bureau of Labor Statistics through the National Compensation Survey. For defined benefit plans, the survey collects data on premiums, administration fees, and dollar amounts placed by employers into pension funds. These amounts may be from cash, stock, corporate bonds, and other financial instruments. For private industry estimates, the National Compensation Survey does not collect actuarial estimates or actual costs of pension benefits paid to retirees.

Benefit costs collected by the survey are converted to hourly rates by dividing the annual costs by the annual hours worked, thus producing the employer costs for employee compensation estimates. These estimates measure compensation costs in cents per hour worked for a specific point in time (for example, the March reference period). The estimates include all employees regardless of access to benefits; this calculation produces lower costs than when eligibility is considered. Benefit incidence rates can be applied to benefit costs estimates to obtain a measure that shows how providing access to a benefit may affect an employer's hourly labor costs. Costs for only those employees with access to a benefit (called *access costs*) can be derived by dividing the benefit costs estimate by the benefit access rate.² For example, if the benefit costs were 48 cents per employee hour worked and 12 percent of employees had access to the benefit then the costs for employees with access would be $\$0.48 \div 12\% = \4.00 per employee hour worked.³

Costs by industry

In goods-producing industries, access costs have increased from \$2.73 per employee hour worked in March 2008 to \$4.48 in March 2015, and from \$1.79 to \$3.00 in service-providing industries. In March 2014, data show that access costs ranged from an average of \$1.10 per employee hour worked in the financial activities industry sector to \$7.63 per employee hour worked in the other services sector. In comparison, access costs in March 2008 ranged from an average of 67 cents in the leisure and hospitality sector to \$5.61 in the construction sector. (See table 1.) The construction sector has had access costs in excess of \$5.00 per employee hour worked from 2008 to 2015. These cost fluctuations raise questions about why some industries see larger cost changes than other industries. The other services industry sector

experienced a sizeable increase from March 2011 through March 2014; however, this sector includes a variety of industries that may contribute to this volatility.

Table 1. Average costs to employers per employee hour worked for providing access to defined benefit plans by industry, private industry, March 2008–15

Characteristic	Year							
	2008	2009	2010	2011	2012	2013	2014	2015
All goods-producing industries	\$2.73	\$2.74	\$2.90	\$3.18	\$3.04	\$3.28	\$4.00	\$4.48
Construction	5.61	5.63	5.94	6.88	6.59	7.18	7.00	6.20
Manufacturing	2.00	1.91	2.00	2.28	2.00	2.15	3.04	3.52
All service-providing industries	1.79	1.68	1.74	1.78	2.06	2.24	2.29	3.00
Trade, transportation, and utilities	1.77	1.59	2.00	1.95	2.00	2.32	2.32	2.42
Information	2.14	1.78	1.26	1.30	3.35	3.43	1.32	8.00
Financial activities	1.31	1.28	1.47	1.55	1.39	1.17	1.10	1.19
Professional and business services	2.92	2.85	2.67	2.75	2.83	3.08	3.43	4.07
Education and health services	1.29	1.29	1.35	1.50	1.44	1.56	2.24	2.50
Leisure and hospitality	0.67	0.67	0.67	1.33	1.33	2.50	2.33	2.67
Other services	1.88	2.44	2.70	2.50	4.67	5.89	7.63	6.67

Unionization

Employees covered by unions tend to have greater access to employee benefits, including retirement plans. Therefore, unionization may affect an employer's costs for defined benefit plans. Higher unionization increases the likelihood that employees will have access to benefits such as defined benefit plans. Data show that 72 percent of union workers had access to defined benefit plans in March 2015, compared with 13 percent of nonunion workers with access. (See chart 1.) However, the access costs for union workers were \$4.44 in March 2015, compared with \$2.77 for nonunion workers. For all workers combined, employer costs for employees with access to defined benefit plans were \$3.39 in March 2015, which is an increase from \$2.05 in March 2008. (See chart 2.) This indicates that other factors, such as the differences in the generosity of the plan and funding, may contribute to increased costs.

Chart 1. Benefit access rates (percentage of workers with access) for defined benefit plans, by union status, private industry, March 2015

Source: U.S. Bureau of Labor Statistics.

Chart 2. Average costs to employer per employee hour worked for providing access to defined benefit plans by occupation group, private industry, March 2008–15

Among the industry sectors with a union presence in 2015, higher levels of representation were found within transportation and utilities (20 percent), construction (14 percent), and manufacturing (10 percent).⁴ However, only 7 percent of the private industry as a whole had union representation in 2015. From the higher unionized industries in 2015, transportation and utilities employed 5.7 million workers, construction employed 7.1 million, and manufacturing employed 14.5 million workers.⁵ The breakdown of the trade, transportation, and utilities sector shows a strong union presence in transportation and utilities, and a smaller union presence in retail and wholesale trade. However, more people are employed in retail and wholesale trade and therefore it represents a larger portion of the trade, transportation, and utilities sector. (See table 2.)

Table 2. Total employed and percentage represented by unions, private industry, 2015

Industry	Total number of employed people	Percentage of the employed represented by unions
Private industry	113,152,000	7
Transportation and utilities	5,722,000	20
Transportation and warehousing	4,765,000	20
Utilities	957,000	22
Construction	7,109,000	14
Manufacturing	14,547,000	10
Wholesale and retail trade	18,798,000	5
Wholesale trade	3,346,000	4
Retail trade	15,452,000	5

States in the Middle Atlantic and Pacific census divisions had union membership rates that were higher than the national average (11.1 percent) in 2015.⁶ States in the East and West South Central divisions had rates lower than the national average. The states with the largest numbers of union members were California (2.5 million) and New York (2 million).⁷ Data show that 25 percent of workers in the Middle Atlantic had access to defined benefit plans in March 2015, compared with 13 percent of workers who had access in the Mountain division. The South region, which consists of the South Atlantic, West South Central, and East South Central divisions, had relatively low levels of access to pension plans despite being the most populated region in the country. (See chart 3.)

Costs by establishment size

The costs for providing access to defined benefit plans do not necessarily increase as employer's establishment size increases. Chart 4 shows that costs were at \$4.08 for establishments with 50 to 99 workers in March 2015, compared with \$3.14 for establishments with 100 to 499 workers. This is an increase from \$1.93 for establishments with 50 to 99 workers and an increase from \$1.83 for establishments with 100 to 499 workers in March 2010. Data show relative stability in the change in costs for establishments with 500 or more workers.

As mentioned earlier, the Middle Atlantic census division has above-average unionization rates and high levels of access to defined benefit plans. Substantial changes in access costs have been recorded for establishments with 50 to 99 workers and goods-producing industries. In addition, goods-producing industries have been shown to account for higher levels of unionization in 2014, even though unionization rates were on the decline.⁸

Generosity and funding

Employers typically pay monthly premiums for benefits such as health insurance, but defined benefit plans are different. Employers have some latitude in deciding when to make payments, although they still must follow legal and accounting guidelines and requirements. Required employer contributions for defined benefit pension plans may fluctuate depending on a company's investment returns. In defined benefit plans, those responsible for managing the plan must act in the interest of plan participants. Therefore, certain investments are restricted by regulation.⁹ For example, a large percentage of funds cannot be invested in a company's own stock. The investment performance of the pension fund plays a role in determining the amount and frequency of employer contributions, data about which are collected through the National Compensation Survey. When plans are underfunded, employers have to catch up and may make additional contributions. When plans are overfunded, employers might not make regular contributions. If a plan earns a rate of return that is equal to or greater than the rate of return promised to retirees, then the plan may become fully funded without additional contributions made by the employer.¹⁰

More generous plans have higher associated costs. Employers may offer both a defined benefit plan and a defined contribution savings and thrift plan to provide more generous retirement benefit to their employees. For defined contribution plans, an employee usually contributes a percentage of his or her salary to an individual account with a savings and thrift plan, and employers may offer to match an employee's contribution up to a set maximum amount. These activities promote retirement saving as employees increase their retirement savings with additional funds from their employer. More generous plans contribute larger amounts in relation to employee contributions. Other factors that may influence employer contributions include how long an employee has worked for the company and whether the employer chooses a flat rate or a variable rate when matching the employee's contribution.

Traditional defined benefit plan types use different formulas to calculate the annuity payment. One formula plan type provides retirees with an annuity based on a predetermined percentage of their final earnings. Another formula uses a percentage of wages earned throughout an employee's entire career at the establishment. A final formula calculates an annuity payment by multiplying the years of service by a specified dollar amount. In addition, employer-contribution formula plans vary based on the policy set forth by employers regarding their specified contribution within the formula.

Nontraditional defined benefit plan types include cash-balance and pension-equity plans. Cash-balance plans promise an employer contribution equal to a percentage of each year's earnings and a rate of return on that contribution, whereas the traditional defined benefit plans typically promise a flat dollar amount.¹¹ A pension-equity plan provides an annuity benefit in terms of a current lump-sum value determined by providing a schedule of percentages that are accumulated throughout the career of the retiree. Accrual rates may vary based on the employee's age and length of service.¹²

The costs for defined benefit plans of union workers tend to be higher than those for nonunion workers. In March 2014, data show that 91 percent of union workers participated in a traditional pension plan, compared with 52 percent of nonunion workers. In contrast, 48 percent of nonunion workers participated in a nontraditional plan, compared with 9 percent of union workers. Both union and nonunion workers participate in plans with a formula that calculates annuities using the percentage of final earnings; however, plans using a formula that multiplies years of service by a specified dollar amount are shown to have 51 percent of union workers participating, compared with 21 percent of all workers combined. (See table 3.)

Table 3. Percentage of workers participating in defined benefit plans: select detailed provisions, private industry, March 2014

Type of plan	All workers	Union workers	Nonunion workers
Traditional defined benefit plan	67	91	52
Percent-of-final-earnings formula	34	27	39
Percent-of-career-earnings formula	8	—	10
Dollars-times-year formula	21	51	—
Employer-contribution formula	4	—	—
Nontraditional defined benefit plan	33	9	48
Cash balance plan	30	8	43
Pension equity plan	3	—	5

Eligibility

Eligibility and features of a plan also affect participation and therefore costs. For example, an employee cannot participate in a defined benefit plan if it is frozen to particular employees, making them ineligible for the benefit. Frozen defined benefit plans are closed to employees not previously participating, or limits are placed on future benefits for some or all active participants. Some frozen plans may no longer allow participants to accrue benefits. Others may change the prospective benefit formula to limit future accruals.¹³ A soft freeze means that a plan is closed to new entrants, but benefit accruals continue for current participants. A hard freeze indicates that a plan is closed to new entrants, and benefits are no longer being accrued for current participants.¹⁴ To reduce costs, employers may freeze plans and provide less generous plan provisions, benefits, and features.

Conclusion

Many factors influence costs to employers that provide access to a defined benefit plan to employees. Administrative aspects, such as policies surrounding a specific plan (generosity, investment, eligibility, etc.), greatly influence the price employers pay for these plans. Such information is employer-specific and may be difficult to collect. Unionization is a useful way to look at the trends in pension costs and access. Data show that lower unionization levels decrease relative access to defined benefit plans, and as the percentage of workers with access decrease, the costs to employers for these plans increase moderately.
